Ready for tomorrow's challenges with a new security concept: the new EAGLE20 security router generation for industrial applications is now available with robust housing and new EAGLE 4.3 software based on the VxWorks operating system.

These high-performance security routers were engineered specially for use in harsh industrial

environments. The new EAGLE20, a universal security module, protects sensitive production areas and enables the long-term integration of office IT and industrial IT networks as an across-the-board solution.
